Pheno Hunting

As a leading name in the craft cannabis scene, we here at Solfire Gardens take great pride in our breeding and testing program. Our team is comprised of experienced and dedicated gardeners who are passionate about developing top tier craft cannabis strains. Our success is rooted in our commitment to excellence, and we believe that our breeding and testing process is second to none.

One of the reasons our customers are so successful at pheno hunting is our use of only the highest quality modern genetics for breeding. We start with elite cultivars and hand selected cuts from our own seed stock, which ensures a solid foundation for our breeding program. This allows us to focus on identifying the most desirable traits and unique characteristics to create the perfect phenos you are looking for.

Our testing process includes multiple stages of evaluation, from seedlings to mature plants. A commitment to homegrown craft cannabis and our meticulous testing practices is reflected in our consistent creation of popular craft cannabis strains, and we take pride in seeing them grown by thousands of growers worldwide.

Overall, our dedication to breeding, along with our in detailed testing process, and commitment to craft cannabis are the reasons that hunting Solfire seeds will always give you the best results.

Germination

Germinating Solfire Seeds with a paper towel is a popular method among growers because it's simple and effective.

Here's a step-by-step guide on how we suggest to do it:

Materials Needed

Solfire Seeds

2 Clean and Moist Paper Towels

2 Plates

Warm, Dark and Undisturbed Place

(Such as a Closet or Cupboard)

Germination Steps

1. Begin by wetting two paper towels and wringing out any excess water.

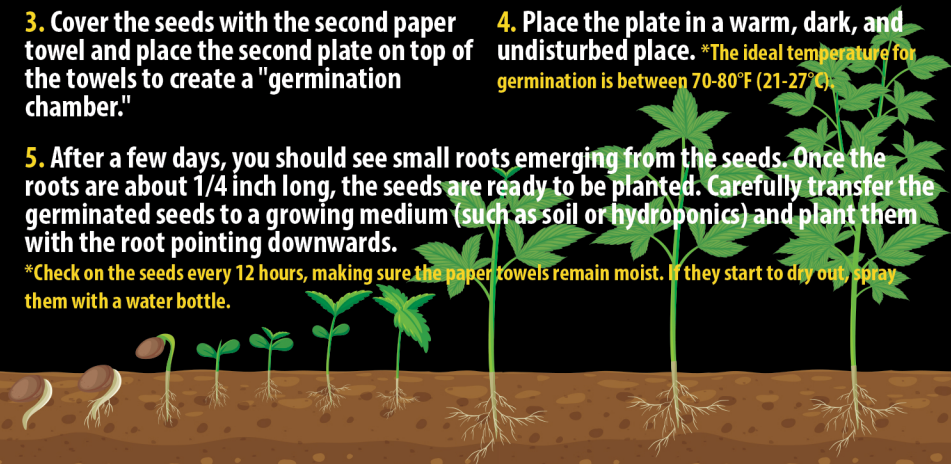

2. Place one paper towel on a plate and then place the seeds on top, spacing them out evenly.

3. Cover the seeds with the second paper towel and place the second plate on top of the towels to create a "germination chamber."

4. Place the plate in a warm, dark, and undisturbed place. *The ideal temperature for germination is between 70-80°F (21-27°C).

5. After a few days, you should see small roots emerging from the seeds. Once the roots are about 1/4 inch long, the seeds are ready to be planted. Carefully transfer the germinated seeds to a growing medium (such as soil or hydroponics) and plant them with the root pointing downwards.

*Check on the seeds every 12 hours, making sure the paper towels remain moist. If they start to dry out, spray them with a water bottle.
